The publication of an article in a peer-reviewed journal is an essential element in the development of a coherent and respected network of knowledge. It is a direct reflection of the quality of the work of the authors and the institutions that support them. Peer-reviewed articles support and embody the scientific method. It is therefore important to establish standards of ethical behavior for all parties involved in the act of publishing: the journal Editors, the peer reviewers, the authors.

Duties of Editorial boards

Publication decisions: The Editors and the Scientific Committee are responsible for deciding which of the articles submitted to the journal should be published. To make that decision the Editors and the Scientific Committee use the evaluation of at least two independent reviewers (double-blind peer review). The editorial committee is guided by the editorial policies of the Journal and by laws relating to slander, copyright infringement and plagiarism.

Fair play: The Scientific committee should evaluate manuscripts for their scientific content without regard to any form of discrimination.

Confidentiality: The Scientific committee and the editorial staff must not disclose any information about a submitted manuscript to anyone other than the corresponding authors, reviewers and Editor. The unpublished material contained in articles submitted to the Journal cannot be used by members of the Scientific committee without the consent of the author.

Disclosure and conflicts of interest: The Editors and the members of the Scientific committee must keep confidential and not use the information or ideas obtained through the review of manuscripts for personal advantage. The reviewers are also required to pay attention to the ethical question, to ensure the originality of the published contributions, to highlight any publications or redundant phenomena of plagiarism, to point out possible conflicts of interest that may arise from competitive relations, collaborations, or other type of connection with the authors, companies or organizations that have relations with the object of the manuscript.

Involvement and cooperation in investigations: If the Editor or the Scientific committee detect or receive signals of a significant problem related to errors, conflict of interest or plagiarism in a published article, they must bear the burden, communicating it to authors and taking appropriate steps to clarify any problems that have emerged.
Duties of reviewers

Contribution to editorial decisions: Peer reviewers participate actively in the decisional process relating to the contributions published in the journal, although the final decision is of the Editors.

Promptness: Peer reviewers who feel unqualified to review the assigned manuscript or think that they are not able to do the review in the required time must give up participating in the review process, communicating it promptly to the editorial committee.

Confidentiality: The information or ideas obtained through the review of the manuscripts must be maintained confidentially and not used for personal advantage.

Standards of objectivity: The reviewers encourage clarity, completeness and accuracy of the reported researches by providing the authors references and comments with regarding objective parameters.

Acknowledgement of sources: The reviewers must express their opinions precisely and with the support of clear and documented arguments through quotations of appropriate literature sources. The reviewers must also indicate bibliographic material relevant to the work to be evaluated but not cited by the authors of the work itself.

Disclosure and conflict of interest: The reviewers are required to pay attention to the ethical issue, to ensure the originality of their contributions, to highlight any publications or redundant phenomena of plagiarism, to point out possible conflicts of interest that may arise from competitive relations, collaborations, or other type of connection with the authors, companies or organizations that have relations with the object of the manuscript.

Duties of authors

Accuracy in the presentation of the manuscripts: Authors must submit with precision and clarity the work performed, discussing objectively its significance. The data should be represented accurately. Manuscripts should contain sufficient details to permit others to replicate the performed researches. Present fraudulent or knowingly inaccurate statements constitutes unethical behavior and therefore is unacceptable.

Data access and retention: Authors of a manuscript may be asked to provide the raw data in order to encourage the editorial process. Such data must be retain for a reasonable time even after the publication of the article.

Originality and plagiarism: The authors should present original work; parts taken from other works must be properly cited. The work of another author cannot be presented as one’s own, nor parts of other works can be copied or paraphrased without appropriate citations. These behaviors are forms of plagiarism and are therefore totally unacceptable.

Multiple, redundant or concurrent publication: The authors must ensure that the manuscripts sent to the journal have not already been published and have not been contemporarily submitted to other journals. The manuscripts must be original and not provide redundant parts respecting other publications.
Acknowledgement of sources: The authors must indicate identifiable sources, citing each publication to which they referred to and any source which has influenced the nature of the research presented in the manuscript. The work of others must be clearly recognized. Any information obtained confidentially or by correspondence cannot be reported without the permission of the source.

Authors of the paper: Those who have actually and concretely contributed to the conception, design, realization or interpretation of the research should be listed as authors of the manuscript. All co-authors must contribute to the drafting of the manuscript, agree on its publication and approve the final version. The names of those who have supported some parts of the research should be listed in the acknowledgments.

Ethics on the participation of humans and animals: The works involving research or experiments with humans or animals must include a statement concerning the conduct of procedures in line with the main related laws. In the case of researches with people it is necessary to indicate clearly to have obtained the informed consent by the participants. Confidential treatment of personal data must be ensured, in full compliance with the Privacy Act.

Conflicts of interest: All authors must declare any conflicts of interest that may affect the results or their interpretation. All the sources that supported the research from a financial point of view must be given.

Errors in published works: When an author discovers a significant error or inaccuracy in his/her own published work, it is the author’s obligation to promptly notify the Editors and cooperate with them to correct the paper. Similarly, if the Editors learn that a published work contains a significant error or inaccuracy, they will contact the authors who will take care to make corrections quickly.
